SAORSTAT EIREANN

DIAGRAM No. 1. MARRIAGE, BIRTH, and DEATH rates for each year from 1901 to 1929, and EMIGRATION from 1924 to 1929

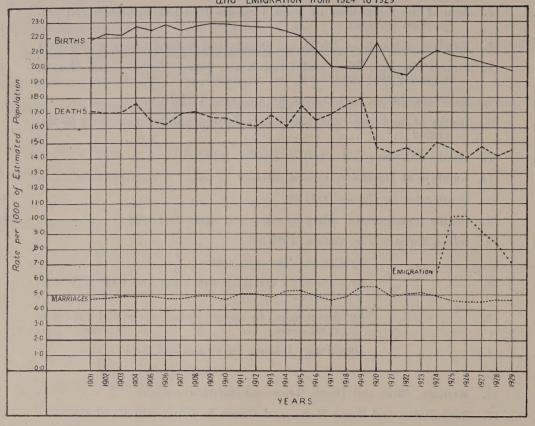

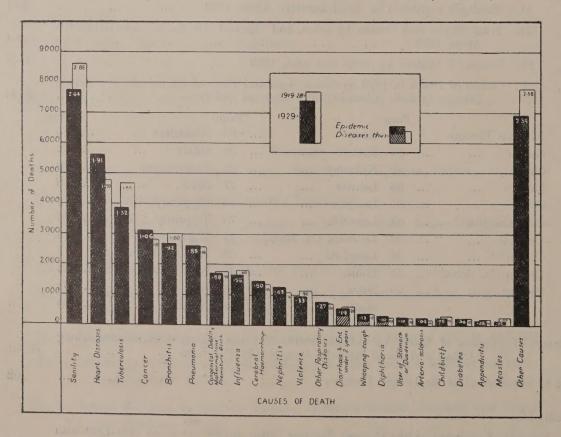

DIAGRAM No 2 Number of DEATHS and rates per 1000 of estimated population from Twenty-one Principal CAUSES and all Other Causes in 1929, with averages for the period 1919-28

REPORT OF THE REGISTRAR-GENERAL FOR THE YEAR 1929.

TO THE MINISTER OF LOCAL GOVERNMENT AND PUBLIC HEALTH.

This Report follows the practice begun in 1923 of correcting the figures for Births and Deaths by excluding those not belonging to the administrative area, and including those belonging to the administrative area, but occurring in other areas.

Two additional features were shown for the first time in the Report for 1928:—

- (1) The standardization of the death rates, *i.e.*, the corrected death rates for administrative areas adjusted to compensate for difference between the age and sex distribution of the local population and that of Saorstát Eireann as a whole, and
- (2) Information in respect of marriages, births and deaths registered in Saorstát Eireann area in each year beginning with 1864—the first year of compulsory registration.

The first of these features is continued in this Report, but the comparative figures given relating to individual years have reference to the period commencing with 1919 in most of the tables, the information for the years from 1864 being given as annual averages for groups of years only. As before stated, particulars for the individual years not shown in this Report are contained in the Report for 1928.

GENERAL SUMMARY.

The estimated population of Saorstát Éireann in the middle of the year 1929 was 2,946,000, being 3,000 under that in the middle of 1928, and 26,000 less than the population as disclosed by the Census of 1926.

The deaths registered during the year 1929 show an increase, and the marriages, births and emigration show decreases as compared with 1928, the decrease in emigration being 3,918.

The number of marriages registered in 1929 was 13,593, being 123 less than the number (13,716) in the preceding year, and 1,377 under the average (14,970) for the ten years, 1919-28.

Expressed in rates per 1,000 of population, the marriage rate in 1929 was $4\cdot61$, in 1928 it was $4\cdot65$, and in the 10 years, 1919-28, the annual average rate was $4\cdot95$.

The marriage-rate in Saorstat Eireann is low as compared with other countries. In Northern Ireland the rate for 1929 was 5.96 per 1,000, in England and Wales 7.9, and in Scotland, 6.76 per 1,000.

Births registered in 1929 numbered 58,280 (legitimate 56,427, and illegitimate 1,853), this being the lowest annual number of total births ever recorded for Saorstát Éireann area. The average annual number for the ten years, 1919-28, was 61,627.

The birth-rate per 1,000 of the total population in 1929 was 19·78, in the preceding year 20·07, and the average annual rate per 1,000 of the estimated average population in the ten years, 1919-28, was 20·41.

A gradual but steady decline in the birth-rate is observable in recent years, from an average of $22\cdot49$ per 1,000 in the period, 1911-15, to $20\cdot57$ in the period, 1924-28, or $8\cdot5$ per cent.

In Northern Ireland the birth-rate in 1929 per 1,000 of population was $20\cdot39$, in England and Wales $16\cdot25$, and in Scotland $19\cdot02$.

The legitimate birth-rate (high as compared with other countries) in 1910-2, based on the number of married women aged 15 and under 45 years in the population as enumerated at the Census of 1911, was 305·4 per 1,000 married women, the corresponding legitimate birth-rate in 1925-7 was 270·8, showing a decrease of 34·6 per 1,000, or 11·3 per cent.

The reduction in fertility during the same period in Northern Ireland was $14\cdot0$ per cent., in England and Wales $30\cdot2$ per cent., and in Scotland $21\cdot3$ per cent. If the fertility of Saorstát Éireann in 1925-7 be taken as 100, Northern Ireland is represented by $84\cdot6$, England and Wales by $51\cdot0$, and Scotland by $67\cdot8$.

The illegitimate birth-rate (low in comparison with other countries) per 1,000 single and widowed women aged 15 to 45 years in 1910-2, was 3·4, and in the years, 1925-7, the rate rose to 4·2, showing an increase of 23·5 per cent.

Based on the total number of births registered the illegitimacy rate was 3.18 per cent. for 1929, 2.80 per cent. for 1925-7, and 2.17 per cent. for 1910-12. In Northern Ireland the rate in 1929 was 4.8; in England and Wales, 4.6; and in Scotland 7.7.

The number of deaths from all causes registered in 1929 was 42,991, or 14.59 per 1,000 of the population, as compared with 41,792 deaths and a rate of 14.17 per 1,000 in 1928, and an annual average of 44,864 deaths with a rate of 14.84 per 1,000 in the ten years, 1919-28.

In Northern Ireland, the crude death-rate in 1929 per 1,000 of the population was 15.91, in England and Wales 13.44, and in Scotland 14.52.

When, however, compensation is made for the differences between the age and sex constitutions of the populations of these countries, and that of Saorstát Éireann as a whole, the latter taken as the standard population, the rates comparable with $14\cdot 59$ per 1,000 for Saorstát Éireann in 1929 become $16\cdot 75$ for Northern Ireland, $15\cdot 37$ for England and Wales, and $16\cdot 57$ for Scotland.

The rate for tuberculosis, which is high as compared with other countries, was $1\cdot 32$ per 1,000 of the population in 1929, as against $1\cdot 37$ per 1,000 in 1928, and an average for the ten years, 1919-28, of $1\cdot 55$ per 1,000. Deaths from tuberculosis in 1929 numbered 3,875 (or $9\cdot 0$ per cent. of the total deaths), in 1928, 4,047, and during the ten years, 1919-28, the annual average was 4,683. The mortality in 1929 was the lowest yet recorded, and is $14\cdot 8$ per cent. below the average for the preceding ten years. The rate for the county boroughs and urban districts in 1929 was $1\cdot 80$ per 1,000, and for rural districts $1\cdot 11$ per 1,000, as compared with $1\cdot 75$, and $1\cdot 21$ respectively in 1928.

A slight decrease in deaths from cancer is recorded, 3,116 deaths having been registered in 1929, equivalent to a rate of $1\cdot06$ per 1,000, as compared with 3,190 deaths, and a rate of $1\cdot08$ per 1,000 in the preceding year.

Deaths from diseases and accidents of pregnancy and child-birth numbered 239 or $4\cdot10$ per 1,000 births registered, as against an average of 300, and a rate of $4\cdot88$ per 1,000 in the ten years, 1919-28.

The rate in respect of such deaths for all urban districts in 1929 was $3\cdot62$ per 1,000 births, and for all rural districts, $4\cdot35$ per 1,000, in comparison with $4\cdot29$ and $5\cdot27$, respectively, in 1928.

The infant mortality (deaths of infants under one year of age per 1,000 births) was 70, being 2 above the rate (68) for the preceding year, and 2 below the average (72) for the preceding ten years.

For county boroughs and urban districts combined, the infant mortality rate in 1929 was 93 per 1,000 births, and for rural districts 58. In 1928 the urban rate was 91 and the rural 56.

The mortality under one year of age among legitimate infants in Saorstát Éireann was 63 per 1,000 legitimate births, and among the illegitimate the mortality in 1929 was 295 per 1,000 illegitimate births. For Northern Ireland the legitimate infant death-rate was 81 and the illegitimate 169; and for England and Wales the corresponding rates were 72 and 126, respectively.

The number of deaths attributed to violence, as registered in Saorstát Eireann in 1929, was 971, comprising 111 suicidal cases, 25 homicidal, 834 accidental and one execution; the numbers in 1928 being 883, 98, 20, 763 and 2, respectively. Of the accidental deaths in 1929, 200 were caused by vehicles, as compared with 150 in 1928. The former included 124 caused by motor-driven vehicles, as compared with 85 in 1928, showing an increase of 39.

Table A.—Showing for each of the years 1919-29 the estimated Population; * the number of Marriages, Births and Deaths registered, with the rates per 1,000 of the estimated Population represented thereby; and the averages for the ten years, 1919-1928; also particulars relating to Northern Ireland for the year 1929.

MOVEMENT OF POPULATION.

The population estimated to the middle of 1929 was 2,946,000, consisting of 1,496,000 males and 1,450,000 females. These figures were arrived at by adding the number of births to the estimated population in the middle of 1928, and deducting the deaths and the balance of migrants outwards to places out of Europe and not within the Mediterranean Sea.

This estimate shows a reduction of 3,000 on that for 1928.

In Table 1, page 2, will be found the estimated populations, by sexes, for years from 1801-1929.

Table B.—Showing the average annual excess of births over deaths (natural increase), the net emigration, and the actual decreases in the populations in the years 1864-70 and in the intercensal periods between 1871 and 1926, with the average annual rates per 1,000 of the mean population; also similar particulars for the years 1927-1929.

Emigration and Immigration.—The returns furnished by the Department of Industry and Commerce (Statistics Branch), show that the number of emigrants to places out of Europe and not within the Mediterranean Sea during the year 1929, was 20,882, including 18,119 bound for the United States, 1,760 for British North America, 497 for Australia, 92 for New Zealand, 74 for British South Africa, 125 for India, and 215 for other countries. During the same period, there were 2,737 immigrants, leaving a net balance outwards of 18,145 persons.

The following Table gives particulars of Emigrants and their destinations in 1929 as compared with the five years preceding:—

Table C.—Number of Saorstát Éireann Emigrants and Immigrants to and from places out of Europe and not within the Mediterranean Sea, together with the destinations of Emigrants during each of the years, 1924-29.

MARRIAGES.

Marriages registered during the year 1929 numbered 13,593, being equivalent to a rate of 4.61 per 1,000 of the estimated population; this rate is 0.04 below that for the previous year, and 0.34 below the average for the ten years, 1919-28.

Of the 13,593 marriages, 12,670 were of Catholics, as compared with 12,782 in 1928, the remaining marriages numbering 923, as against 934 in 1928. Included in the 923 marriages were 660 celebrated according to the rites and ceremonies of the Protestant Episcopalian Church, as against 653 in 1928; 116 as compared with 122 in 1928, were in Presbyterian Meeting-houses; 60 as against 61 in 1928 in "Registered Buildings" belonging to various other religious denominations; 74 by civil contract in the Registrars' offices, as against 85 in 1928; one was according to the usages of the Society of Friends; and 12 were according to the Jewish rites.

According to the Census of 1926, Catholics represented $92 \cdot 6$ per cent of the population, Protestant Episcopalians $5 \cdot 5$ per cent., Presbyterians $1 \cdot 1$, Methodists $0 \cdot 4$ and all other denominations $0 \cdot 4$.

In 1929 Catholic marriages were 93.2 per cent. of the total marriages, which is slightly above the proportion of Catholics in the population.

The rate per 1,000 of the estimated Catholic population represented by the number of marriages of Catholics was $4\cdot64$, or $0\cdot36$ under the corresponding average rate for the preceding ten years, and the rate for other marriages was equivalent to $4\cdot23$ per 1,000 of all persons other than Catholics in the population, this rate being $0\cdot25$ below the corresponding average rate for the ten years, 1919-28, as shown in the following table:—

Table D.—Marriages registered in 1929, and in each of the previous ten years, according to the Modes of Celebration; with the rate per 1,000 of the population represented by Catholic and all other marriages.

It will be found from the figures given in the Abstract of Marriages, pages 46-7, that $91 \cdot 5$ per cent. of the total marriages were those of bachelors and spinsters; that $5 \cdot 5$ per cent. were those of widowers and spinsters; that $1 \cdot 9$ per cent. were marriages of bachelors and widows; and that those of widowers and widows formed $1 \cdot 1$ per cent. of the total marriages. Thus, of the men married $6 \cdot 6$ per cent. were widowers, and of the women $3 \cdot 0$ per cent. were widows, or in 85 instances in every 1,000 marriages, one or both of the contracting parties had been in the married state before.

In the following Table, the county, county borough and provincial rates per 1,000 of the population are given for 1929 in comparison with the annual averages in 1925-7 and 1910-12.

Table E.—Marriages (per 1,000 of the population) for counties, county boroughs and provinces, 1910-12, 1925-7, and 1929.

				Ulster Province (pt. of)	4.55	3.90	3.72	

From the foregoing table it will be observed that the marriage rates vary considerably as between county and county borough areas, the highest in 1929 being recorded for Limerick county borough, viz., $10 \cdot 09$ per 1,000 of the population, and the lowest, $2 \cdot 96$ per 1,000 for Limerick county. Between these the five areas having the highest rates were Cork county borough (8 \cdot 85), Dublin county borough (7 \cdot 50), Dublin county (5 \cdot 81), Waterford county borough (5 \cdot 22), and Carlow county (5 \cdot 08), and the lowest areas were Mayo (3 \cdot 20), Laoighis (3 \cdot 22), Galway (3 \cdot 46), Monaghan (3 \cdot 55), Roscommon (3 \cdot 61), and Westmeath (3 \cdot 61).

The table shows that the experience of 1925-7 and 1929 in the counties and county boroughs follows on rather similar lines that of 1910-2, and it will be observed that the county boroughs and Dublin county (which is largely urban), contain the highest marriage rates.

Marriages, like births and deaths, must be registered in the registration area in which the events take place, and as this area is not in many cases the area of residence of the parties, or even of one of them, and as marriages of Catholics, which constitute about 93 per cent. of all marriages in Saorstát Éireann, may be celebrated in any part of the country, there being no statutory requirement in respect of residence (as is the case in most marriages other than Catholic), the determination of marriage rates for localities is not wholly satisfactory.

Parish boundaries, in numerous cases, cut across county and county borough boundaries, and for this reason alone many Catholic marriages take place in a church in the county which is not the county of residence of the parties, and moreover, for fashionable or other reasons, an appreciable proportion of the marriages in the larger urban areas related to persons whose residences, in respect of both parties, were outside these areas.

The wide divergence of the county and borough rates from the average is shown for the three periods dealt with in the table, and for the reasons above stated, the county or borough rates do not represent the facts as regards residents of the area. The table shows the relative frequency with which marriages are celebrated in individual areas and if the rates for each area over the periods of time are compared it will be found that they show comparatively little variation. Comparison of province with province will, however, largely minimise the error in respect of the area of residence of the parties married.

In 1929 the rate for Leinster was $5\cdot 39$ per 1,000 of the population, for Munster $4\cdot 49$, for Connaught $3\cdot 49$, and for Ulster (part of) $3\cdot 72$, the average for Saorstát Éireann being $4\cdot 61$.

In the three years, 1925-7, the provincial rates follow the same curve as also those for 1910-2, except that the rate for the three Ulster counties exceeds that for Connaught in the latter period.

In 1929 the marriage-rate for Northern Ireland was 5.96, for England and Wales 7.9, and for Scotland 6.76 as compared with the low rate for Saorstát Eireann, viz., 4.61 per 1,000.

Based on the number of marriageable males in the population of Saorstát Eireann (single and widowed males 15 years of age and upwards according to the Census of 1926) the average annual number of males married in the years 1925-7 was 20·7 per 1,000, the females married being equivalent to 21·9 per 1,000 of the female marriageable population.

The corresponding figures for Northern Ireland were $31\cdot8$ per 1,000 for males and $27\cdot2$ per 1,000 for females, and for England and Wales $52\cdot7$ and $40\cdot4$, respectively.

The marriage-rate by quarters for the years 1919-29, distinguishing Catholic marriages from all other marriages, is given in Table 5.

The marriage-rate for the first quarter of the year 1929 is 4.5 per 1,000 of the population, for the second 4.6, for the third 5.1, and for the fourth 4.3.

Up to 1928 Catholic marriage-rates were highest in the first quarter and lowest in the fourth, while for all other marriages the third quarter would appear to be most favoured by the parties, with the least preference for the first quarter.

For marriages of Catholics registered in 1929, however, for the first time in the history of registration, the rate for the third quarter was higher than that for the first.

Evidence of the progress of elementary education is afforded by the signatures of the contracting parties in the marriage registers or certificates. In the year 1929 there were 13,292, or 97·8 per cent. of the husbands, and 13,433, or 98·8 per cent. of the wives who wrote their names as against 16,490 or 95·9 per cent. of the husbands, and 16,717 or 97·2 per cent. of the wives in 1919.

The particulars for each of the years 1919-29 are given in the following table (F), as well as those relating to persons not of full age, and re-marriages.

Table F.—Showing as regards Marriages in Saorstát Éireann, during the years 1919-29, the proportion of Persons who Signed Their Names, of Persons not of Full Age, and of Re-Marriages.

			Signed their Names in Writing		ot of Full	Re-Marriages

The entry of "Minor," or "Full Age" satisfies the requirements of the law as far as the ages of the contracting parties to marriages in Ireland are concerned. This circumstance, which is taken advantage of in the vast majority of cases, is to be regretted, as a record of the ages of the persons married would be of much value from many points of view.

The proportion of husbands who married under age was highest in the province of Leinster, viz., $2 \cdot 3$ per cent., in Munster it was $1 \cdot 0$, in Connaught $0 \cdot 5$, and in Ulster (part of) $1 \cdot 0$, while the percentage of wives who were minors was for Leinster $9 \cdot 1$, for Munster $4 \cdot 8$, for Connaught $5 \cdot 1$, and for Ulster (part of) $8 \cdot 5$.

In Northern Ireland, the proportion per cent. of males married in 1929 who were under age was $3 \cdot 0$, and of females $13 \cdot 0$.

In England and Wales the corresponding proportions were $4\cdot 2$ and $15\cdot 2$, and in Scotland $5\cdot 6$ per cent. of the males married in 1928 and $18\cdot 8$ of the females were under age.

It will thus be seen that the percentage of persons married in Saorstát Éireann who were minors is much below that of Great Britain.

The number of Licences issued by the Registrars during the year 1929 for Marriages in Registered Buildings and in the Registrars' Offices in Saorstát Éireann, was 119. On 31st December, 1929, the number of such Registrars of Marriages authorized to grant Licences for Marriages under 33 and 34 Vic. cap. 110 and 34 and 35 Vic. cap. 49, was 103.

Marriage Licences issued by Licensing Ministers of the Protestant Episcopalian Church amounted to 566. The number of Licensing Ministers on the 31st December, was 146.

The number of Licences for Marriage issued by the Licensing Ministers of the Presbyterian bodies in Saorstát Éireann during the year 1929 was 104 (all by the General Assembly). The number of Licensing Ministers on the 31st December, 1929, was 53, of whom 51 were with the General Assembly and 2 with the United Presbytery or Synod of Munster.

In Ireland there being no civil restrictions as to time or place for celebrating marriages between Catholics a registration of the churches and chapels of the Catholic Church is not necessary. With reference to other religious bodies, a record is kept of the places of Divine Worship, in which marriages may lawfully be solemnized otherwise than by special licence. On 31st December 1929, there were 1,073 churches and chapels of the Protestant Episcopalian Church, 152 registered Presbyterian Meeting-houses (150 General Assembly and 2 United Presbytery or Synod of Munster), and 174 "Registered Buildings" belonging to the various religious denominations so circumstanced.

The number of "Registered Buildings" belonging to the several religious bodies in which marriages may lawfully be solemnized is shown in the following list:—

Denominations	No. of Places of Worship	No. of Places Denominations of Worship	
Methodists	135	Salvation Army 1	
Reformed Presbyterians	5	Seceders 2	
Baptists	8	"The Catholic Apostolic	
Independents or Congregation-		Church '' 1	
alists	6	Welsh Presbyterians 1	
Christian Brethren	10	"Undenominational" 4	
Moravians or United Brethren	1		_
		TOTAL 174	

BIRTHS.

The number of births of infants born alive registered during the year 1929 was 58,280 (29,583 boys and 28,697 girls) being 896 (744 boys and 152 girls) below the number recorded for the year 1928. The rate per 1,000 of the population represented by the births in 1929 was 19.78, and was 0.29 per 1,000 under the low rate for the preceding year and 0.63 per 1,000 below the rate for the ten years 1919-28.

With the exception of those for the years 1921 and 1922, the rate recorded for 1929 is lower than that for any of the preceding ten years (Table 4 and Diagram 1).

In Tables 16 and 17 will be found the birth rates for provinces, counties, county boroughs and urban and rural areas. For the province of Leinster the rate in 1929 was 21·43 per 1,000, for Munster 18·96, for Connaught 18·15, and for Ulster, (part of) 17·40 per 1,000, as compared with 21·60, 19·33, 18·59 and 17·78 respectively, in 1928.

Among the counties and county boroughs the rates varied from $28\cdot67$ per 1,000 for Limerick county borough, to $16\cdot29$ for Sligo county, and of the intermediate rates the five highest were $26\cdot88$ for Dublin county borough, $23\cdot12$ for Waterford county borough, $22\cdot73$ for Cork county borough, $21\cdot18$ for Kildare county, and $20\cdot36$ for Limerick county, the five lowest being $16\cdot48$ for Cork, $16\cdot62$ for Cavan, $17\cdot07$ for Roseommon, $17\cdot13$ for Monaghan, and $17\cdot20$ for Waterford.

The county boroughs and urban districts in the aggregate show a rate of $23 \cdot 55$ per 1,000 in 1929, and the combined rural districts $18 \cdot 21$ per 1,000, as compared with $23 \cdot 69$ and $18 \cdot 56$ respectively, in the preceding year.

In Northern Ireland the birth rate per 1,000 of the population in 1929 was $20 \cdot 39$, in England and Wales $16 \cdot 25$, and in Scotland $19 \cdot 02$. For Belfast county borough the rate was $21 \cdot 65$, for London $15 \cdot 82$, and for Edinburgh $17 \cdot 1$.

It will be seen from Table 4 that the annual average birth rate recorded was highest during the period, 1871 to 1880, viz., $26 \cdot 31$ per 1,000, falling to $22 \cdot 88$ per 1,000 in 1881-90, to $22 \cdot 20$ per 1,000 in 1891-1900, rising to $22 \cdot 54$ in 1901-10, but falling to $21 \cdot 50$ per 1,000 in 1911-20.

For the six years 1924-29 the fall has been steady and continuous from $21 \cdot 10$ per 1,000 in 1924 to 19 · 78 per 1,000 in 1929. The latter shows a reduction of $8 \cdot 11$ per 1,000, or $29 \cdot 1$ per cent., as compared with the highest birth rate reached during the period of compulsory registration, viz., $27 \cdot 89$ per 1,000 in 1871.

It should be stated, however, that the rates calculated in terms of the total population (crude birth rates) form but an imperfect measure of the changes in fertility, i.e., the rate of reproduction in proportion to the opportunity of reproduction, if the proportion of potential mothers in the population varies from period to period. The importance of variation in this respect will be realized if it is borne in mind that the number of married women, 15 to 45 years of age, amongst whom are the mothers of 97 per cent. of all the infants whose births were registered in 1929, represents less than $7\frac{1}{2}$ per cent. of the total population.

The crude birth rate is, however, a convenient form of statement when the object in view is to record the net result of the various factors governing reproduction.

It sums up the effects of all the influences governing the rate at which the community is reproducing itself and is, therefore, in conjunction with the corresponding form of mortality statement, the crude death rate, the appropriate means of measuring natural increase.

The following statement shows the changes that have taken place in the proportion and the age constitution of the married female population at conceptive ages, as disclosed by the Censuses from 1871 to 1926.

Table G.—Showing the proportion per cent. of wives aged 15 and under 45 years to all females at these ages together with the ratio per 100 for wives at each of four age groups to all wives aged 15 to 45, based on the Censuses 1871 to 1926.

Census	Wives aged 15 and under 45 years per cent.	Proportion per	cent. of total wi	ves aged 15 and	under 45 years
YEAR	of all Women at these ages	15-	20-	25-	35-45
1871	41.23	1.08	10.86	46.84	$41 \cdot 22$
1881	37.88	0.76	9.54	42.09	47.61
1891	33.65	0.60	8.33	42.20	48.87
1901	31.98	0.44	8.02	44.29	$47 \cdot 25$
1911	33.42	0.32	6.40	4 2·72 .	$50 \cdot 56$
1926	34.98	0.45	6.78	41.91	50.86

It will be borne in mind that fertility diminishes with advancing years and that variations in the ages at which women marry must have some effect on the birth rates, but this factor is not taken into account in any of the calculations made for the purposes of this Report.

The following table gives the birth rates viewed from different standpoints for six triennial periods, embracing census years.

Table H.—Average annual birth-rates in triennial periods round about the six censuses 1871-1926, the figures in brackets affording a comparison of the periods from 1880 to 1927, with 1870-2, the rate for the latter taken as 100.

			Annual Aver	age Births		
	Per 1,000	Legit	imate		Illegitimate	
Period	of Census Population at all Ages.	Per 1,000 of Census Population at all Ages.	Per 1,000 Married Women 15-45 Years.	Per 1,000 of Census Population at all Ages.	Per 1,000 Single and Widowed Women aged 15-45 Years.	Per cent. of Total Births.
1870–2 1880–2 1890–2 1900–2 1910–2 1925–7	27·54 (100) 23·96 (87) 21·74 (79) 21·91 (80) 22·70 (82) 20·56 (75)	27·04 (100) 23·54 (87) 21·34 (79) 21·46 (79) 22·21 (82) 19·98 (74)	306 · 63 (100) 283 · 69 (93) 287 · 39 (94) 292 · 16 (95) 305 · 40 (100) 270 · 80 (88)	0·50 (100) 0·42 (84) 0·40 (80) 0·45 (90) 0·49 (98) 0·58 (116)	3·94 (100) 3·10 (79) 2·78 (71) 2·92 (74) 3·40 (86) 4·20 (107)	1·80 (100) 1·76 (98) 1·87 (104) 2·08 (116) 2·17 (121) 2·80 (156)

A more precise view of the variations in the birth-rates for these four areas is given in the following statement.

Table J.—Average Annual Number of Legitimate Births per 1,000 married women aged 15 and under 45 years in Saorstát Éireann, as compared with Northern Ireland, England and Wales and Scotland during the triennial periods, 1870-2, 1880-2, 1890-2, 1900-2, 1910-2, and 1925-7. The figures in brackets for the last five periods are comparable with those for 1870-2, the latter taken as 100.

Description	Legitimate Births per 1,000 married women, 15 and under 45 years of age												
PERIOD	Saorstát Éireann	Northern Ireland	England and Wales	Scotland									
1870-2	306.6 (100)	306.5 (100)	291 · 1 (100)	319.4 (100)									
1880-2	283.7 (93)	280.7 (92)	285·3 (98)	311.5 (98)									
1890-2	287.4 (94)	288.1 (94)	262·1 (90)	296.4 (93)									
1900-2	292 · 2 (95)	283·3 (92)	235.0 (81)	271.8 (85)									
1910-2	305.4 (100)	266 · 2 (87)	197.7 (68)	233.2 (73)									
1925-7	270.8 (88)	229.0 (75)	138.0 (47)	183.6 (57)									

It will be observed from this table that, while the rates for the area of Saorstát Éireann and for Northern Ireland followed very closely the same lines for the first three periods, in the next two they took the opposite course, that whereas the decline in fertility in the former area took place some time within the last fifteen years covered by the table, in the latter area the decline would appear to have set in twenty years before.

In both England and Wales and Scotland, the loss in fertility has been constant from period to period since 1870.

At the period 1925-7, as compared with the period 1910-2, Saorstát Éireann would appear to have lost $11\cdot 3$ per cent. in fertility, Northern Ireland, $14\cdot 0$, England and Wales, $30\cdot 2$, and Scotland, $21\cdot 3$.

The relative positions in respect of fertility of the four areas in 1925-7 are as follows:—Saorstát Éireann, taken as 100, Northern Ireland, 84·6, England and Wales 51·0, and Scotland 67·8. As before indicated, no account is taken in these calculations of the differences in the age constitutions of the married female populations within these areas.

Illegitimate births, in number 1,853, which constituted $3 \cdot 2$ per cent. of the total births registered in 1929, are 65 above the number recorded in 1928, the percentage increase being $0 \cdot 2$.

It should be stated that the rate for illegitimate births is lower for Saorstát Eireann than for most other countries, e.g., the ratio per cent. of total births in Northern Ireland in 1929 was $4\cdot 8$, in England and Wales $4\cdot 6$, and in Scotland $7\cdot 7$.

The rates, by provinces, are shown in the following statement for the years 1924-29:—

	Illegitimate Births—per cent. of Total Births.											
	1924.	1925.	. 1926.	1927.	1928.	Average 1924-8.	1929.					
Saorstát Éireann	2.65	2.68	2.81	2.93	3.02	2.82	3.18					
Leinster	3.22	3.25	3.36	3.47	3.47	3.35	3.64					
Munster	2.73	2.69	2.90	2.79	3.17	2.86	3.37					
Connaught	1.22	1.13	1.30	1.41	1.66	1.34	1.56					
Ulster (part of)	2.46	3.02	2.77	3.83	3.02	3.02	3.45					

Table 16 supplies the information as regards illegitimacy in 1929 by provinces, counties, and county boroughs. The five highest counties were Limerick (5·65 per 100 total births), Tipperary South Riding (5·65), Wexford (5·50), Kildare (5·45), and Wicklow (5·43), and the lowest five were Leitrim (0·92), Mayo (1·21), Roscommon (1·40), Cork county borough (1·57), and Limerick county borough (1·59).

Wexford county $(6\cdot 59)$, Kildare $(5\cdot 13)$, and Tipperary S.R. were also among the five highest in 1928, and Mayo $(1\cdot 07)$, Roscommon $(1\cdot 53)$, and Cork county borough $(2\cdot 02)$ among the five lowest.

The three counties with the highest illegitimacy rate during the three years, 1925-7, were Wexford (5.02), Carlow (4.79), and Kildare (4.72 per 100 births).

In 1929 the proportion of male infants born alive to every 1,000 females was 1,031. This is the lowest ratio ever recorded; in 1928 the ratio was 1,051; in 1927, 1,039; in 1926, 1,053; in 1925, 1,052; in 1924, 1,066; and in 1923, 1,064. The average for the five years, 1924-8, was 1,052. In England and Wales, the proportion of males born alive to 1,000 females was 1,043 in 1929, being one below the average for the five preceding years, and in Scotland the proportion in 1929 was 1,059, which is 10 above the average for the five years 1923-7.

Table 4 shows the proportions for Saorstát Éireann by periods covering the years 1864-1929.

The male children born in wedlock in 1929 numbered 28,635, and the female 27,792, or 1,030 of the former to every 1,000 of the latter, and of the illegitimate children 948 were males and 905 females, or 1,048 boys to every 1,000 girls.

The following statement shows the total number of infants, by sexes, whose births were registered during each quarter of 1929:—

		1st Quarter.	2nd Quarter.	3rd Quarter.	4th Quarter.	Total.
Males Females	***	7,164 6,987	7,742 7,603	7,647 7,346	7,030 6,761	29,583 28,697
TOTAL	• • •	. 14,151	15,345	14,993	13,791	58,280

Of the total births 50.6 per cent, were registered in the first six months (181 days) and 49.4 per cent, in the second six months (184 days).

For the province of Leinster the birth-rate was 21·43 per 1,000 of the population; for Munster 18·96; for Connaught 18·15, and for Ulster (part of) 17·40.

MULTIPLE BIRTHS.

Of the 58,280 infants whose births were registered during the year 1929, 56,794 or 97.45 per cent. were single births, 1,468, or 2.52 per cent. were twins, and 18, or 0.03 per cent. were triplets.

In 1928, the percentage of single infants to total infants was $97 \cdot 53$, of twins, $2 \cdot 43$, and of triplets, $0 \cdot 04$.

The number of mothers of living children during the year was 57,534. Of these 56,794, or $98\cdot71$ per cent. gave birth to single infants, 734, or $1\cdot28$ per cent. to twins, and 6, or $0\cdot01$ per cent., to triplets.

The infants born in wedlock (56,427) as registered in 1929, include 54,969 single infants, or $97 \cdot 42$ per cent. of the total births, 1,440 twins, or $2 \cdot 55$ per cent., and 18 triplets, or $0 \cdot 03$ per cent.

Illegitimate infants (in number, 1,853) include 1,825 single, or $98\cdot49$ per cent. of the total illegitimate infants, and 28 twin infants or $1\cdot51$ per cent.

Of the total infants born alive, resulting from multiple births, 742 were males, and 744 females.

It should be borne in mind that the figures given above relate to live births, as still births are not registered in this country, and that, therefore, the birth of one living child and one still born or one living child and two still born is counted as a single birth, and the birth of two living children and one still born is counted as a twin birth.

DEATHS.

The deaths registered during the year 1929 numbered 42,991, affording a rate of $14 \cdot 59$ per 1,000 of the estimated population. The deaths of males amounted to 21,547, or $14 \cdot 40$ per 1,000 of the estimated male population, the deaths of females numbering 21,444, equivalent to $14 \cdot 79$ per 1,000 of the estimated female population.

The mortality from all causes and for both sexes in 1929 is 0.42 per 1,000 (or 3.0 per cent.) more than that for 1928 (viz. 14.17), but 0.25 per 1,000 (or 1.7 per cent.) below the average for the ten years 1919-28 (viz. 14.84).

For Northern Ireland the crude death rate per 1,000 in 1929 was 15·91; for England and Wales 13·44, and for Scotland 14·52.

In Abstract I, the total number of deaths as registered in each county, county borough and superintendent registrar's district is given, as well as the number corrected by the inclusion of deaths of residents of each area which occurred elsewhere in Saorstát Éireann, and by the exclusion of deaths of residents belonging to other localities, and in Tables 16 and 17, the provincial, county, urban and rural rates are given.

Rates based on the deaths so corrected represent the frequency of death in the population of the particular area, but as the age and sex constitution of the populations varies in different localities it becomes necessary to make allowance for such variations, in order to afford comparison of the rate for each area with that for the whole of Saorstát Éireann.

Accordingly the rates in 1929 for provinces, counties, county boroughs, the larger towns and the aggregate urban and rural districts in each county have been standardized on the basis of the age and sex constitution of Saorstát Éireann as a whole, at the Census of 1926. The effect of correction and standardization is shown in the following statement in respect of counties, county boroughs and provinces.

Table K.—Showing the effect on the Death-rates in 1929, in Counties County Boroughs, and Provinces, of correction for Transfers and of standardization for age and sex constitution, based on the distribution of the population of Saorstát Éireann, as a whole, as shown by the Census of 1926.

		Death-rates in	1929 per 1,0	00 population

Saorstát Éireann	14.59	14.59	14.59		

This table again presents the striking increases in the corrected death-rates of the four county boroughs which result from standardization. The rate for Cork was thus increased from 16.92 to 19.98 per 1,000, which is the highest standard rate for county and county borough areas. Dublin comes next with a standard rate of 19.69, to which it was raised from 16.53, followed by Waterford (18.94) increased from 17.08, and Limerick, with a rate of 18.87, to which it was raised from the rate of 16.35 per 1,000. If the comparison were made on the corrected deaths only, the order from highest to lowest would be: Waterford, Cork, Dublin and Limerick.

Turning to the mortality by sexes, it is found that the crude mortality in Dublin county borough for males in 1929 was $16\cdot70$ per 1,000 of the male population, and for females $16\cdot38$ per 1,000 of the number of females in the population. The standardized rates were $20\cdot28$ per 1,000 for males, and $19\cdot03$ per 1,000 for females.

In Cork county borough the crude rates for males and females were 16.98 and 16.86, and the standardized rates 20.91 and 19.11, respectively.

In Limerick county borough the crude rates for males and females were $16 \cdot 80$ and $15 \cdot 93$, and the standardized rates $19 \cdot 93$ and $17 \cdot 78$.

In Waterford county borough the crude rate for males was $18\cdot09$ and for females $16\cdot15$, and the standardized rates $20\cdot06$ and $17\cdot76$.

Taking the county boroughs and urban districts in the aggregate, the results show that the crude death rate for both sexes was $15 \cdot 52$ per 1,000 of the population, the rate for males being $15 \cdot 67$ and for females $15 \cdot 38$, while for rural areas the rate for persons was $14 \cdot 21$, for males $13 \cdot 96$, and for females $14 \cdot 47$.

As the result of standardization the sex rates for rural districts in the aggregate are brought closer together, viz., $13\cdot45$ for males and $13\cdot30$ for females, the rates for the aggregate of the urban areas becoming $18\cdot57$ for males and $17\cdot12$ for females, and showing a much wider divergence than that which obtains in the case of the crude rates.

Thus the true mortality among the males in the population of urban areas is $5 \cdot 12$ per 1,000, or $38 \cdot 1$ per cent., and among the females $3 \cdot 82$ per 1,000 or $28 \cdot 7$ per cent., above that prevailing in rural areas.

If the mortality were based on the crude rates alone, the mortality for males in urban areas would show an excess over rural of $12 \cdot 2$ per cent., and for females of $6 \cdot 3$ per cent.

Among administrative counties, the five having the highest standardized rates were Dublin (16·01), Kildare (15·91), Wicklow (15·62), Westmeath (15·52), and Meath (15·42), the lowest five being Mayo (11·41), Kerry (11.49), Galway (12·18), Roscommon (12·21), and Clare (12·29).

An example of the modifications, made by standardization, of the proportion borne by deaths registered per 1,000 of the population at different times in Saorstát Éireann area is afforded by the following statement, which shows the average annual death-rates from all causes, by sexes, in 1925-7, per 1,000 of the population according to the Census of 1926, as compared with those recorded in each of the triennial periods round about each of the five preceding censuses, the latter rates being standardized so as to make allowance for the difference in the age and sex constitution of the population in the census years

concerned and the corresponding distribution of the population according to the Census of 1926, the latter being taken as the standard population.

		AVERAGE	ANNUAL D	EATH-RATES	AS RECOR	RDED AND S	TANDARDIZE	D-PER 1,00	0 OF POPU	LATION.	
	187	0-2	1880-2		1890-2		190	0-2	191	1925-7	
-	As recorded	Standard- ized	Recorded death-rate								
Persons	16.85	19.03	17.77	20 · 44	17.91	20.99	17.75	20.36	16.35	15.81	14.48
Males	17.33	19.44	18 · 10	20.75	17.83	21.06	17.85	20.38	16.32	16.35	14.33
Females	16.39	18.57	17.45	20.11	17.99	20.90	17.65	20.31	16.37	15.49	14.63

The effect of the adjustment for the varying age and sex constitution of their populations is further exemplified in the following statement showing the death-rates for the year 1929, from all causes, per 1,000 of the population in Northern Ireland, England and Wales, and Scotland, together with those for their capitals, and the aggregate of the rural areas of England and Wales, and Scotland, as compared with the corresponding areas of Saorstát Éireann.

Area.				Recorded Death-rate per 1,000	Standardized Death-rate per 1,000
Saorstát Éireann	• • •		• • •	$14 \cdot 59$	14.59
Northern Ireland	• • •			$15 \cdot 91$	$16 \cdot 75$
England and Wales				$13 \cdot 44$	$15 \cdot 37$
Scotland	• • •		• • •	$14 \cdot 52$	$16 \cdot 57$
Aggregate (Saorstát Éire	ann		•••	$14 \cdot 21$	$13 \cdot 37$
Rural \{ England and		• • •		$\overline{12\cdot 67}$	$12 \cdot 68$
Districts Scotland	•••		•••	12.91	13.76
(Dublin*		•••	• • •	16.53	19.69
Rolfast.	•••	• • •		$15 \cdot 64$	$18 \cdot 99$
Cities { London	•••		•••	$14 \cdot 24$	$16 \cdot 71$
Edinburgh	•••	• • •	•••	$\overline{15.07}$	16.86

As the result of standardization the mortality for Saorstát Éireann as a whole in 1929 is lower than that for any other section of the two islands.

The standardized mortality for Dublin city (19.69 per 1,000), is 3.7 per cent. higher than that for Belfast (18.99), 17.8 per cent. higher than the rate for London (16.71), and 16.8 per cent. above that for Edinburgh (16.86).

The standardized rate for the rural districts of Saorstát Éireann is somewhat lower than that for the rural areas of Scotland but higher than that for the aggregate of rural districts in England and Wales.

The following statement shows, by sexes, the number of deaths of persons registered during each quarter of the year 1929.

		1st Quarter.	2nd Quarter.	3rd Quarter.	4th Quarter.	Total.
Males Females	• • •	6,915 7,015	5,427 5,468	4,400 4,124	4,805 4,807	21,547 $21,444$
TOTAL	* * *	13,960	10,895	8,524	9,612	42,991

Of the total deaths 24,855, or $57 \cdot 8$ per cent., were recorded during the first six months and 18,136, or $42 \cdot 2$ per cent., in the second six months.

^{*}For Dublin Registration Area, the standardized death rate is 18.97 per 1,000. (See Table 17).

The annual rate per 1,000 of the population represented by deaths registered in the first quarter of the year was $19 \cdot 0$; in the second quarter, $14 \cdot 8$; in the third, $11 \cdot 6$; and in the fourth, $13 \cdot 1$, as compared with $18 \cdot 1$, $16 \cdot 0$, $12 \cdot 0$, and $13 \cdot 4$, respectively, for the four quarters of the ten years, $1919 \cdot 28$ (Table 5).

DEATHS IN INSTITUTIONS.

Abstract V. gives particulars relating to deaths by certain causes in institutions, and for each county and county borough. Of the 42,991 deaths 3,589, or $8\cdot 3$ per cent. took place in general and special hospitals, 1,214, or $2\cdot 8$ per cent. in mental hospitals, 6,524, or $15\cdot 2$ per cent. in county homes and hospitals or in workhouse hospitals, county infirmaries and district hospitals, and 31,664 occurred elsewhere.

CAUSES OF DEATH.

In Tables 7 and 8 are given the number of deaths from some of the principal causes by periods covering the years 1864-1929 and the rates per 100,000 of the population represented thereby.

It will be noted that enteric fever and typhus are not differentiated in the table for the years 1864-71, as in later years, and that the term "Simple Continued Fever" appears for the years 1872-1910.

In this connection, it should be stated, that deaths returned under this latter heading, now numbering only a few, have been, from 1911, assigned to "Causes Ill-defined or Unknown."

A large number of deaths which included those ascribed in the Registers vaguely as "Fever" were assigned to "Simple Continued Fever" in the earlier years of registration.

In the statement which follows, the numbers of deaths from some of the principal diseases are shown for the years 1928 and 1929, also the averages for the ten years, 1919-1928.

		ber of D				ber of I

Encephalitis Lethargica Meningococcal Meningitis	34 21	46 18	34 18	Diseases Other Accidents and Diseases of Pregnancy and Childbirth	80 159	103	106

The total number of deaths registered in 1929 is 1,199 more than the number registered in 1928. The causes which contributed increases, as will be seen from the above table, were influenza, with an increase of 801; heart disease, with an increase of 499; bronchitis, 269; pneumonia, 250; whooping cough, 114; diphtheria, 79; meningococcal meningitis, 3; and dysentery, one.

On the other hand, the following diseases caused fewer deaths in 1929 than in 1928:—measles (decrease 230); tuberculosis (172); cancer (74); other accidents and diseases of pregnancy and childbirth (30); puerperal sepsis (23); scarlet fever (17); encephalitis lethargica (12); diarrhoea and enteritis of children under two years (10); and enteric fever (6).

A comparison of these two groups shows that the increase in deaths in 1929 occurred chiefly in deaths from influenza, and from respiratory and heart diseases.

In the previous year a fall in the first two of these causes accounted for the low mortality of that year, as in 1927 a rise under the three headings was accompanied by a rise in the general mortality, so that the general death-rate would appear to depend in great measure on fluctuations in deaths from respiratory diseases.

The rates per 1,000 of the population represented by the deaths from the principal epidemic diseases* are shown in Table 16, which gives the information by provinces, counties and county boroughs; from this table it will be seen that the rate in all areas in 1929 was 0.53 per 1,000 of the population, the rates varying from 0.19 for Kildare county, 0.24 for Mayo county, and 0.26 for Westmeath county, to 2.33 for Waterford county borough, 1.47 for Cork county borough, and 1.01 per 1,000 for Dublin county borough.

Table 17 shows that the mortality rate from this group of causes for all urban areas (county boroughs and urban districts) was 0.89 per 1,000 of the population, being considerably more than twice the rate for rural districts—0.38 per 1,000.

ENTERIC FEVER.—There were 88 deaths from enteric fever (of males 48 and of females 40), including 2 from paratyphoid fever, recorded during the year 1929. This is 6 below the number recorded in 1928, and 36 below the average (124) for the ten years 1919-28. Twelve deaths appertained to urban areas and 76 to rural (see Abstract VI).

TYPHUS.—Seven deaths from typhus were registered, this being the same number as in 1928, as against an average of 15. Of the 7 deaths in 1929, 4 were those of males and 3 of females.

SMALL-Pox.—No deaths from small-pox occurred during the year, nor since 1907, during which year one death was registered.

Measles.—One hundred and thirty-nine deaths were caused by measles (77 of males and 62 of females). This number is only 38 per cent. of the mortality (369) recorded during the preceding year, and is 116 below the average for the ten years, 1919-28, viz., 255. Of the 139 deaths, 112 were those of children under 5 years of age, including 74 under 2 years.

Scarlet Fever.—Deaths from this disease amounted to 62, as compared with 79 in 1928, and an average of 85 for the ten years ending with the latter year. Of the 62 deaths, 29 were those of males and 33 of females.

Whooping-cough.—Deaths from whooping-cough numbered 393. This number is 6 below the average (399) for the preceding 10 years, but 114 above the number in 1928.

Of the 393 deaths (of males 186 and of females 207) 371 were those of children under 5 years of age, 197 of the latter being infants under one year of age.

The deaths recorded for urban areas numbered 182 and for rural areas 211; in 1928 these numbers were 95 and 184 respectively, so that the increase in 1929 related chiefly to urban districts.

DIPHTHERIA.—Deaths from this disease numbered 304, or 10·3 per 100,000 of the estimated population, as compared with 225, or 7·6 per 100,000 in 1928 and an average of 269 (rate 8·9) for the ten years 1919-28 (Tables 7 and 8). Of the 304 deaths 160 were those of males and 144 of females; these numbers include 130 deaths of children under 5 years of age and 117 between 5 and 10 years, so that 247 or 81 per cent. of the deaths from diphtheria at all ages in 1929 were those of children under 10 years of age.

^{*} Enteric Fever, Typhus, Small-pox, Measles, Scarlet Fever, Whooping-cough, Diphtheria, Dysentery, and Diarrhoeal Diseases.

For urban areas in the latter year, 143 deaths were recorded, representing 16.5 per 100,000 of the population, and for rural areas 161 deaths, or 7.7 per 100,000, as compared with rates of 12.1 and 5.8 respectively for the preceding year.

Particulars by ages and sexes, details for counties and county boroughs and for urban and rural areas are shown in Abstracts IV. to VI.

A reference to these abstracts shows that of the 304 deaths, 214 or about 70 per cent. were recorded for the following areas:—Dublin county borough (59), Dublin county (22), Cork county (57), Cork county borough (36), Galway county (26), and Wexford county (14).

No deaths from the disease were recorded for Carlow, Longford, Kerry or Leitrim county.

The rates based on 100,000 of the population represented by the above deaths were:—for Dublin county borough, $18\cdot 5$, for Dublin county $11\cdot 5$, for Cork county $19\cdot 8$, for Cork county borough $46\cdot 0$, for Galway county $15\cdot 4$, and for Wexford county, $14\cdot 6$.

About 39 per cent. of the deaths from diphtheria for the county borough of Dublin related to the Registrars' Districts of North City No. 1 West and South City No. 1, and about 50 per cent. of those recorded for the county borough of Cork were referred to the Registrars' Districts Cork urban No. 4 and No. 7.

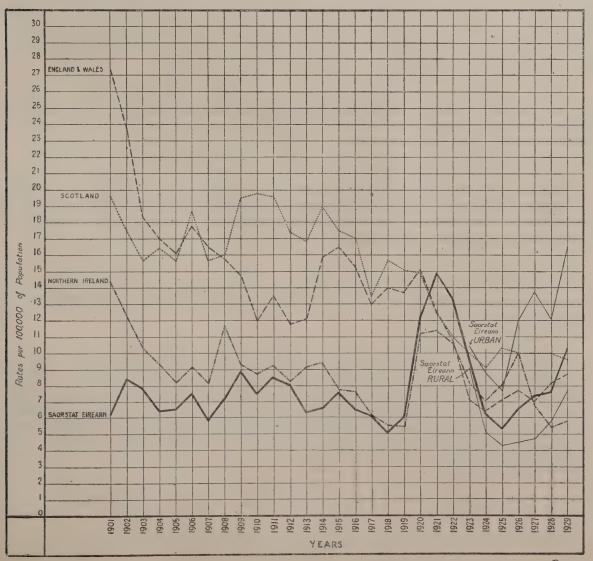

Nine of the 22 deaths for Dublin county belonged to Dublin rural district.

Of the 57 deaths for Cork county, 19 appertained to Cork rural district, 6 to Bandon rural district, 5 to Fermoy rural district, 5 to Macroom rural district, and 5 to Passage West urban district.

Of the 26 deaths for Galway county 8 related to Tuam rural district and 6 to Galway rural district.

The following Diagram shows the trend of the mortality from this disease during the present century, represented by the rates per 100,000 of the population of Saorstát Eireann, Northern Ireland, England, and Wales, and Scotland.

Diagram No. 3 Death-rates from DIPHTHERIA in SAORSTAT EIREANN, NORTHERN IRELAND, ENGLAND and WALES, and SCOTLAND during each of the years' from 1901 to 1929.

Dysentery.—To this cause 9 deaths were attributed, as compared with an average of 14 for the preceding ten years.

DIARRHEA AND ENTERITIS (children under 2 years).—The number of deaths of children attributed to these causes during the year 1929 was 559; this number is 49 less than the average (608) for the ten years 1919-28, and 10 less than the number in 1928.

Of the 559 deaths (307 of males and 252 of females) 166, or 30 per cent., appertained to Dublin county borough.

The mortality among children under 2 years in 1929 from diarrhoea and enteritis for all urban areas based on the births recorded therefor, was 17·1 per 1,000 and for rural areas the corresponding rate was 5·6 per 1,000, the respective rates for the preceding year being 18·2 and 5·1.

INFLUENZA.—A severe epidemic of influenza prevailed during the first quarter of the year and continued into the second, during which it would appear to have almost entirely subsided. The deaths registered during the year numbered 1,659, and of these about 56 per cent. were registered in the first quarter, 30 per cent. in the second, only 6 per cent. in the third, and 8 per cent. in the fourth.

Of the 1,659 deaths, 781 were those of males and 878 of females, the rates per 1,000 of the population represented by these figures being 0.56, 0.52 and 0.61, respectively.

The 1,659 deaths in 1929 are nearly double the number (858) registered in the preceding year. Since the great epidemic of 1918 and 1919, the mortality in 1929 has been exceeded three times—in 1922 with 1,812 deaths, in 1924 with 2,073 deaths, and in 1927 with 2,099 deaths—but is 478 above the average (1181) for the 9 years 1920-8 (Table 7A).

Of the 1,659 deaths, 385, or $4\cdot 4$ per 10,000 of the population, related to urban areas, and 1,274, or $6\cdot 1$ per 10,000, to rural areas, as compared with $2\cdot 4$ and $3\cdot 1$, respectively for 1928.

Table L, which gives the particulars for each sex, and for certain age-periods, by provinces, counties and county boroughs, shows that 1,115, or 67 per cent. of the deaths, were those of persons aged 55 years and upwards, including 822, or nearly half, of persons aged 65 years and upwards.

The provincial rates per 10,000 of the population for deaths from influenza at all ages were $11 \cdot 23$ for Ulster (part of), $6 \cdot 04$ for Leinster, $4 \cdot 97$ for Connaught, and 3.64 for Munster.

It will be seen that the counties which suffered most in mortality were all inland, with the exception of Donegal, for which county the rate was 11.41 per 10,000 of the population. Apart from Donegal, the highest rates, taking the country from North to South, related to the following counties:—Leitrim (7·15 per 10,000), Monaghan (11·98), Cavan (10·31), Longford (14·81—the highest county rate), Westmeath (9·68), Offaly (9·13), Laoighis (12·22), Tipperary North Riding (6·87) and Carlow (8·70).

The lowest rates related to counties in the southern and western seaboards—Wexford (2·09), Waterford county (3·27), Waterford county borough (3·00), Cork county (2·89), Cork county borough (1·66—the lowest rate for a county or county borough), Kerry (3·49), and Clare (3·68).

The rates for counties on the eastern seaboard were $6\cdot08$ per 10,000 for Wicklow, $4\cdot82$ for Dublin county, $5\cdot13$ for Dublin county borough, $6\cdot03$ for Meath, and $6\cdot06$ for Louth.

Of the total deaths from influenza 562 were associated with pulmonary complications, and 1,097 were returned as from influenza without qualification or were from that disease complicated with maladies other than pulmonary.

The fluctuations in the mortality from influenza are shown in the following diagram:—

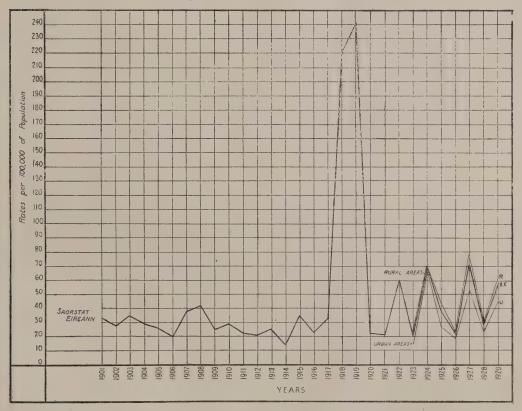

Table L.—Showing for each sex by Provinces, Counties and County Boroughs the number of Deaths from Influenza at each of eight age-periods registered in Saorstát Éireann during the year 1929, with the rate per 10,000 of the population represented by the number of deaths at all ages.

ERYSIPELAS.—There were 28 deaths (14 of males and 14 of females) from this cause, as compared with 34 in 1928.

ENCEPHALITIS LETHARGICA.—Encephalitis lethargica caused 34 deaths. This is the second successive year in which a marked decrease in this disease is recorded. The number is 12 less than the number in 1928 and 23 less than in 1927. Twenty-two of the 34 deaths in 1929 were of males, and 12 of females.

MENINGOCOCCAL MENINGITIS.—This disease caused 21 deaths (15 of males and 6 of females) or 3 above the number for 1928, and 3 above the average for the 10 years 1919-28.

OTHER EPIDEMIC DISEASES.—There were 5 deaths (4 males and one female) from malaria, 5 (one male and 4 females) from acute poliomyelitis, 4 deaths (2 males and 2 females) from varicella, 3 deaths (one male and 2 females) from mumps, 2 (one male and one female) from cholera nostras, one (a male) from spirochaetosis ictero-haemorrhagica, and one (male) from Kala-azar.

Tetanus.—The number of deaths from tetanus was 18, those of males being 14 and of females 4, as against a total of 17 (11 of males and 6 of females) in 1928.

TUBERCULOSIS.

Deaths from all forms of tuberculosis registered during the year 1929 numbered 3,875, equivalent to a rate of $1\cdot32$ per 1,000 of the population. The corresponding rate in Northern Ireland in 1929 was $1\cdot29$, in England and Wales $0\cdot96$, and in Scotland $0\cdot94$.

If the rates for the latter areas be adjusted so as to make allowances for the differences between the age and sex distributions of their populations and that of Saorstát Eireann, the resulting standardized rates show the mortality for the latter in a still more unfavourable light, as follows:—Northern Ireland, $1\cdot26$; England and Wales $0\cdot93$, Scotland $0\cdot93$.

The total number of deaths of males from tuberculosis was 1,910, equal to a rate of 1.28 per 1,000 of the male population, and the number of deaths of females, 1,965, equal to a rate of 1.36 per 1,000 of the female population, as will be seen from the table on the next page.

In Northern Ireland the rate for males in 1929 was $1\cdot18$ per 1,000 and for females $1\cdot40$; in England and Wales $1\cdot12$ and $0\cdot81$; and in Scotland $1\cdot00$ and $0\cdot88$ respectively.

It will be seen that the sex incidence of the disease in Great Britain is the opposite of that obtaining in Ireland. This statement holds good for the Saorstát Eireann area for each year back to 1918, but for the years 1911-17 there was an excess in the male mortality. For each year of the period, 1911-29, the death rate from tuberculosis among females was greater than that among males in the Northern Ireland area.

Table M.—Showing, by sexes, the mortality from tuberculosis in Saorstát Éireann during each of the years 1919-29.

^{*} Decrease in 1928 as compared with 1919.

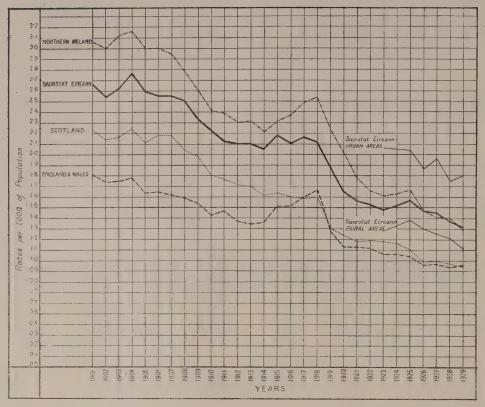

This table presents the fall in the mortality from tuberculosis which has taken place since 1919. The deaths for 1929 are the fewest ever recorded.

This result is altogether due to a reduction in the deaths from tuberculosis of the respiratory system, which numbered 2,999, as compared with 3,189 in 1928. Deaths from other forms of tuberculosis increased by 18, the number registered being 876, as against 858 in 1928. The decrease was also confined entirely to rural areas, where a reduction of 215 deaths took place, whereas in urban areas there was an increase of 43.

The following are the numbers of deaths from the different forms of tuberculosis under which such deaths are classified; tuberculosis of the respiratory system, 2,999 (1,446 males, and 1,553 females); tuberculosis of the meninges, 224 (112 males, and 112 females); tuberculosis of the intestines and peritoneum, 238 (107 males and 131 females); tuberculosis of the vertebral column, 77 (46 males and 31 females); tuberculosis of the joints, 48 (30 males and 18 females); tuberculosis of other organs, 86 (56 males and 30 females); and disseminated tuberculosis, 203 (113 males and 90 females).

Diagram No. 5 illustrates the variations in the mortality from tuberculosis in Ireland, England and Wales, and Scotland, since 1901. From this the almost continuous decline in the disease is evident; it is also notable how closely the curve for Saorstát Eireann follows the variations of that for Scotland, whereas the curve for Northern Ireland is very similar to that for England and Wales.

In the following Table and Diagram (No. 6) the mortality from tuberculous disease at different age periods is shown for each sex during the period, 1912-14, as compared with 1927, 1928, and 1929. The great reduction at all age periods and for each sex is apparent. The decrease in 1929 as compared with 1912-14, was $36\cdot 8$ per cent. for all persons, $39\cdot 9$ per cent. for males, and $33\cdot 7$ for females. The greatest decrease has occurred at ages under 15, the rate under 5 years being $54\cdot 3$ per cent. less than in 1912-14, at 5-10 years $50\cdot 0$ per cent. less, and at 10-15 $47\cdot 7$ per cent. less. Except at the higher ages, where the figures concerned are too small for comparative significance, the least decrease is seen in the age period 20-25, viz., $23\cdot 1$ per cent.

Table N.—Death-rates from Tuberculosis by sexes and ages per 1,000 of the population at same age, in Saorstát Éireann, during the period, 1912-14, and during the years 1927, 1928, and 1929.

^{*} Including Carcinoma, Sarcoma, and Cancer, Malignant Disease.

Tumours.—Only tumours either definitely stated to have been non-malignant, or as to which, as the result of special enquiries regarding their nature, further information was not obtainable, are included under this heading.

There were 43 deaths from cerebral tumour (of males 23 and of females 20); 20 from tumours of the ovary; 26 from tumours of the uterus; and 52 from tumours of other or unstated sites (23 of males and 29 of females).

The latter included 11 returned as from tumour of the abdomen, 8 of intestine, 5 of mediastinum, 4 of neck, 4 of bladder, 4 of spine, 3 of lung, 2 of spleen, 2 of head, and one of each of the following:—gall bladder, liver, nose, pelvis, kidney, pituitary body, prostate, throat and rectum.

RHEUMATISM.—There were 108 deaths (53 of males and 55 of females) from rheumatic fever, and 292 deaths (123 of males and 169 of females) from chronic rheumatism, osteo-arthritis and gout.

Diabetes.—To this cause 229 deaths were attributed, 136 being deaths of males and 93 of females. The total deaths are 3 below the number for the year 1928, and 4 above the average for the 10 years 1919-28. The following statement shows the death-rates from diabetes per 100,000 of population in Saorstát Éireann, Northern Ireland, and England and Wales, covering the eleven years 1919-29.

1	PERIOD.		Saorstát Éireann.	Northern Ireland.		SCOTLAND		
			,			-		
Annual Average	1919-23	3	$7 \cdot 3$	$10 \cdot 6$	$11 \cdot 0$	$10 \cdot 0$		
**	1924-28		$7 \cdot 6$	$9 \cdot 2$	$11 \cdot 9$	$10 \cdot 2$		
Year	1924		$7 \cdot 1$	$7 \cdot 9$	$10 \cdot 9$	$10 \cdot 0$		
9,9	1925		$7 \cdot 4$	$8 \cdot 3$	$11 \cdot 2$	$9 \cdot 3$		
,,	1926		$7 \cdot 6$	$10 \cdot 2$	$11 \cdot 5$	$10 \cdot 6$		
,,	1927		7.8	$9 \cdot 6$	$12 \cdot 6$	$10 \cdot 6$		
,,	1928		$7 \cdot 9$	10.0	$13 \cdot 1$	$10 \cdot 7$		
,,	1929		$7 \cdot 8$	$9 \cdot 2$	14.2	$12 \cdot 6$		

In respect of the areas treated in this statement, with the exception of Northern Ireland, a decided tendency towards increased mortality from diabetes among both sexes, as shown by the rates for quinquennial averages, is manifest, but with this exception, the higher mortality is due entirely to the increase in the death-rate of females.

The rate for males in Saorstát Éireann per 100,000 of the male population in the two periods (1919-23 and 1924-8) remains the same, viz., 7·8, while for females the rate increased from 6·8 in the earlier to 7·3 per 100,000 in the later period. In Northern Ireland the male mortality fell from $11\cdot3$ to $9\cdot7$ and the female from $10\cdot2$ to $8\cdot7$.

The rate for males in England and Wales, fell from $10 \cdot 9$ to $10 \cdot 6$ per 100,000, but in the case of females it rose from $11 \cdot 1$ to $13 \cdot 1$. In Scotland the mortality for males showed a fall from $8 \cdot 9$ to $7 \cdot 7$, that for females increasing from $11 \cdot 0$ to $12 \cdot 6$ per 100,000.

In Saorstát Eireann the rate for males in 1929 was $9\cdot 1$ per 100,000, and for females $6\cdot 4$; in Northern Ireland the rate for males was $10\cdot 3$, and for females $8\cdot 2$; in England and Wales the rates for males and females were $12\cdot 2$ and $16\cdot 1$, and in Scotland $9\cdot 9$ and $15\cdot 2$ respectively.

Alcoholism.—Thirteen deaths were ascribed to alcoholism, all of these being of males. Cirrhosis of the liver caused 91 deaths, 73 being those of males, and 18 of females. All except 2 males were aged 30 years and upwards.

ANÆMIA.—Deaths from pernicious anæmia and other forms of anæmia in 1929 numbered 269, consisting of 111 deaths of males and 158 of females.

Pernicious anæmia caused 181 deaths, 87 being those of males and 94 of females, as compared with an average of 93 males and 106 females for the preceding five years 1924-8. In the case of deaths from other anæmias, those of males numbered 24 in 1929, which was 8 below the average, while the number of deaths of females was 64, being 15 above the average (49) for the five years preceding.

Other General Diseases.—Among these were one (a male) from beri-beri, 26 deaths from rickets, 48 (8 males and 40 females) from exophthalmic goitre, 13 from other diseases of the thyroid gland (4 males and 9 females), 4 (2 males and 2 females) from tetany, 3 from diseases of thymus (one male and 2 females), 19 (7 of males and 12 of females) from diseases of the adrenals, 3 (2 males and one female) from disease of the spleen, 21 (16 males and 5 females) from leukæmia, 23 (14 males and 9 females) from lymphadenoma (Hodgkins' disease), 5 (males) from chronic lead poisoning, and one (a female) from veronal poisoning. Among 34 other deaths under this heading 26 (21 males and 5 females) were returned as occurring from purpura; 3 (all males) from hæmophilia; 2 (one male and one female) from toxæmia, and 3 females from acidosis.

MENINGITIS AND ENCEPHALITIS.—Deaths from meningitis numbered 317 (deaths of males numbering 166, and of females 151) as compared with 310, 170, and 140 respectively in 1928.

The number of deaths from encephalitis (not returned as encephalitis lethargica) was 25, and from cerebral abscess 13, as against 33 for these two diseases combined in 1928.

CEREBRAL HÆMORRHAGE.—The number of deaths returned under this heading was 1,463, comprising 642 deaths of males and 821 of females. These figures include the deaths of 54 males and 80 females caused by cerebral thrombosis and embolism.

The 1,463 deaths are 2 below the number recorded in 1928, but 108 above the average for the 10 years, 1919-28.

EPILEPSY.—There were 175 deaths (of males 87, and of females 88) from epilepsy, as compared with 180 in the preceding year.

Convulsions.—The number of deaths ascribed to convulsions was 487 (of males 273, and of females 214); of these, 402, or 82·5 per cent. were those of infants under one year of age, constituting 9·8 per cent. of the deaths from all causes of infants under one year of age registered during the year.

HEART DISEASE.—To this group, 5,616 deaths (of males 2,687, and of females 2,929) were assigned, equivalent to a rate of 1.91 per 1,000 of the estimated population, and contributing 13.1 per cent. to the mortality from all causes. The number of deaths is the highest for the past fourteen years, and the rate afforded is the highest ever recorded. The number is 499 above that for 1928, and 831 above the average (4,785) for the ten years 1919-28.

Of the 5,616 deaths, 28 were ascribed to pericarditis, 148 to acute endocarditis and myocarditis, 154 to angina pectoris, 1,310 to valvular disease, 97 to fatty degeneration, and in 3,879 instances the particular form of heart disease was unstated, or was other than those enumerated above.

ARTERIO-SCLEROSIS.—There were 252 deaths from arterio-sclerosis, of which 154 were those of males, and 98 of females. This number is 5 below the number registered in 1928, and 68 above the average for the preceding 10 years.

Bronchitis.—The deaths from this cause numbered 2,696 (of males, 1,270, and of females, 1,426), being equivalent to a rate of 0.92 per 1,000 of the population, or 6.3 per cent. of the total number of deaths from all causes. The number of deaths is 269 above the number for 1928, but 319 below the average for the ten years, 1919-28.

PNEUMONIA.—Deaths from pneumonia (all forms) amounted to 2,608, and afford a rate of 0.89 per 1,000 of the population; they comprise 1,175 from bronchopneumonia, 295 from lobar pneumonia, and 1,138 from pneumonia (not otherwise defined).

The 2,608 deaths include 1,434 deaths of males and 1,174 of females, are 15 above the average for the ten years, 1919-28, and 250 above the number in 1928: this latter increase is due to an increase in broncho-pneumonia.

PLEURISY; EMPYEMA.—The number of deaths classed to empyema regarding which the originating cause other than pleurisy could not be ascertained, was 25; the males numbering 17, and the females 8; and the deaths registered from other pleurisy were 120, 64 being deaths of males, and 56 of females.

There were also 4 other deaths returned as having been caused by empyema, but as the result of special enquiries, sufficient information was obtained to enable them to be classified to other causes, viz., one to pneumonia, 2 to tuberculosis, and one to influenza.

ULCERS OF THE STOMACH AND DUODENUM.—To this cause 284 deaths were attributed, 193 being those of males and 91 of females. The total number is 56 below the number in 1928, but 29 above the average (255) for the ten years, 1919-28.

APPENDICITIS.—The deaths so classified numbered 154 (of males 96, and of females 58) being 7 below the average (161) for the ten years preceding.

CIRRHOSIS OF THE LIVER.—Deaths from this cause, viz., 91 (of males 73, and of females 18) are 11 under the average for the ten years 1919-28.

Acute and Chronic Nephritis.—The number of deaths from acute nephritis was 223 (117 of males and 106 of females) and from chronic nephritis 1,048 (598 of males and 450 of females). The total number of deaths from the acute and chronic disease was 1,271, which number is 58 above that for 1928, and 179 above the average for the ten years 1919-28.

PREGNANCY AND CHILDBIRTH.

The mortality of women during pregnancy and childbirth is classified under three headings, namely (1) septic conditions, (2) intrinsic accidents and diseases of pregnancy and childbirth, and (3) diseases or causes associated with pregnancy and childbirth. To the first group 80 deaths were attributed in the year 1929, to the second, 159, and to the third 44; altogether the deaths of childbearing women numbered 283. This number, which is 35 below that for the year 1928, represents a rate of 4.85 per 1,000 of the total births registered, as compared with 5.37 in the year 1928, and with an average rate of 5.43 per 1,000 for the decade, 1919-28.

Table Q shows that in the mortality from puerperal septic diseases in 1929, there was a decrease as compared with 1928, the numbers being 80 and 103, respectively, a decrease in the mortality from accidents of pregnancy and childbirth, to which 159 deaths were attributed in 1929, as against 189 in 1928. The deaths of women from causes associated with pregnancy and childbirth, which were 26 in the year 1928, numbered 44 in the year under review.

Tables 16 and 17 give the rates per 1,000 births for (1) and (2) by provinces, counties and county boroughs and groups of urban and rural areas.

Table P.—Showing the number of deaths of women in 1929 definitely returned as either caused by or associated with PREGNANCY or CHILDBEARING.**

VIOLENCE.

Deaths caused by violence, as registered during the year 1929, amounted to 971, a number equivalent to 0·33 per 1,000 of the estimated population, being 88 above that recorded for 1928, and 99 above the average (872) for the five years, 1924-28. As compared with the preceding year, there was an increase in 1929 of 13 in suicides, 5 in homicides and 70 in other external causes, including accidental, 50 deaths of the latter increase having been ascribed to vehicles, of which 39 were motor driven.

Of the 971 deaths, 111 were classed to suicide, 25 to homicide, and one to execution, leaving 834 to other deaths by violence, the great majority of which were definitely stated to have been accidental.

The suicidal cases comprise the deaths of 89 males and 22 females: in 19 cases poisoning was the means adopted to cause death, strychnine being used in 9 instances, coal gas in 3, opium in 2, carbolic acid in 2, carbon monoxide in 2, and acetic acid in one.

Of the 25 homicidal cases, 18 were deaths of males (including 7 infants under one year of age) and 7 of females (including 6 infants under one year of age).

The death by execution was that of a male.

Among accidental deaths, 11 (8 males and 3 females) were caused by poisons or poisonous gases; the poison in 2 cases was strychnine, in 2 lysol, and in 4 cases arsenic, belladonna berries, chlorodyne, and corrosive sublimate, respectively, while the gases (which each caused one death) were sulphuretted hydrogen, coal gas, and one not specified. There were also two deaths from food poisoning.

One hundred and sixty deaths (60 of males, and 100 of females) were due to burns and scalds, 70 being those of children under 5 years of age. Deaths from accidental drowning numbered 125 (100 of males, and 25 of females), and deaths from accidental injury by firearms 13 (all of males).

Deaths caused by vehicles numbered 200 (157 of males and 43 of females). Of these deaths 124 were caused by motor driven vehicles, 31 horse-drawn, 21 were by railway vehicles, 21 were ascribed to bicycles, 2 to trams, and one was not described. This classification shows a remarkable increase in the deaths caused by motor vehicles and by bicycles: the former have increased by 39, or 46 per cent. more than in 1928, and the latter by 15. The number by motor vehicles is almost three times the number recorded in 1922, when 44 deaths were registered. In 1923 the number was 55, in 1924 46, in 1925 53, in 1926 70, and in 1927 and 1928 it was 85.

A further analysis of the figures in 1929 shows that 63 of the deaths ascribed to motor vehicles were due to motors or motor cars, 37 to buses, 12 to motor cycles, 11 to motor lorries or trailers, and one to a taxi, and from this it is apparent that the increase is due to buses, motor cycles and lorries, the number of deaths from these vehicles in 1928 having been 12, 7 and 2 respectively.

UNCERTIFIED CAUSES.

Among the 42,991 deaths registered, 9,855 were not certified by medical practitioners, nor were inquests into their causes held. They constitute $22 \cdot 9$ per cent. of the total mortality in 1929, as against an average of $26 \cdot 2$ for the ten years, 1919-28. The number of uncertified deaths in urban areas in 1929 was $3 \cdot 5$ per cent. of the total number of deaths relating thereto, the corresponding percentage for rural areas being $31 \cdot 8$.

INQUESTS.

According to returns furnished by the registrars the number of inquests during the year 1929 was 1,137, or one inquest for every 38 deaths registered.

AGES AT DEATH.

Of the 42,991 deaths at all ages, 5,992 or $13 \cdot 9$ per cent. were deaths of children under 5 years of age, including 3,307 deaths of males, or $15 \cdot 3$ per cent. of the male mortality at all ages, and 2,685 deaths of females, or $12 \cdot 5$ per cent. of the total number of deaths of females.

The deaths of 19,842 persons aged 65 years and upwards were registered during the year, constituting $46 \cdot 2$ per cent. of the total number of deaths at all ages, and include 9,479 of males, or $44 \cdot 0$ per cent. of the total deaths of males, and 10,363 of females, or $48 \cdot 3$ per cent. of the deaths of females at all ages.

Among the deaths of persons at these ages 15,871, or 36.9 per cent. of the total deaths, were 70 years of age or over.

Deaths of persons aged 95 years or upwards numbered 257 (of males 118, and of females 139) and they include 58 (males 25, and females 33), whose ages at death were returned as 100 years or upwards.

The ages in detail of the persons whose deaths were registered in the year 1929 are given in Abstract III.

The following statement shows the variations in the death-rates at different age-periods between 1928 and 1929:—

DEATH-RATES FOR EACH AGE PERIOD PER 1,000 OF THE POPULATION AT THE SAME AGE.

		Persons.			MALES.			FEMALES.

In Table 9 are given the number of deaths by sexes and ages, and the average annual rates per 1,000 of the population at the same ages, during 1864-70 and each subsequent decennium.

INFANT MORTALITY.

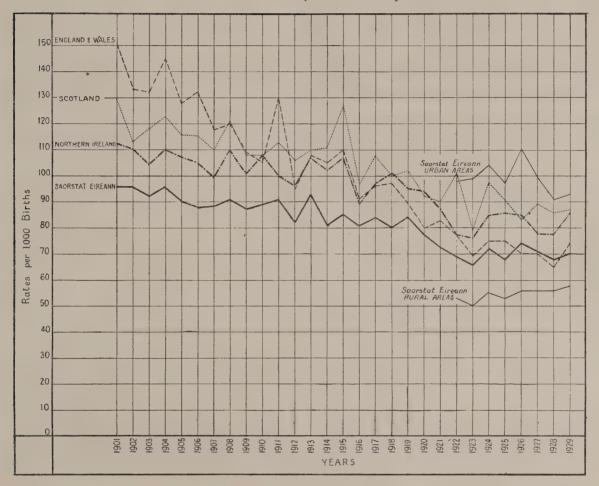

The number of deaths of infants under one year of age registered during the year 1929 was 4,102, equivalent to a rate of 70 per 1,000 births, as compared with 68 per 1,000 in 1928, and an average of 72 for the ten years 1919-28.

The deaths of male infants numbered 2,332, being equal to 79 per 1,000 births of males, and the deaths of female infants, 1,770, or 62 per 1,000 births of females, the corresponding rates for 1928 being 74 and 62 respectively.

For Northern Ireland the infant mortality in 1929 was 86 per 1,000 births; for England and Wales the rate was 74; and for Scotland 87 per 1,000 births.

The following Diagram (No. 8) shows the experience of each of these countries in infant mortality since 1901, as compared with Saorstát Eireann.

DIAGRAM No. 8. INFANT MORTALITY IN SAORSTAT EIREANN, NORTHERN IRELAND, ENGLAND & WALES, and Scotland, during each of the years from 1901 to 1929.

From Table 11 which gives the infant mortality rates by sexes, ages and causes, it will be seen that mortality from atrophy, debility, $(17 \cdot 61)$, diarrhoea and enteritis $(8 \cdot 49)$, premature birth $(8 \cdot 22)$, pneumonia $(7 \cdot 24)$, convulsions $(6 \cdot 90)$, bronchitis $(3 \cdot 88)$, and whooping-cough $(3 \cdot 38)$, in the aggregate, is equivalent to $55 \cdot 72$ per 1,000 births, or 79 per cent. of the total infant mortality.

Of the deaths of infants, $36 \cdot 1$ per cent. were under one month old, $12 \cdot 6$ per cent. between one and two months; $10 \cdot 4$ per cent. between 2 and 3 months; $19 \cdot 0$ per cent. were aged 3 and under 6 months, and $21 \cdot 9$ in every 100 were 6 and under 12 months old.

Urban and Rural Mortality.

There were 1,903 deaths of infants recorded for urban areas, equivalent to 93 per 1,000 births, and the number of such deaths in rural areas was 2,199, or 58 per 1,000 births.

The infant mortality for Belfast in 1929 was 112 per 1,000 births; for Londonderry 110; for London 71; for Liverpool 97; for Edinburgh 80; and for Glasgow 107.

A reference to Table 12 shows that the infant mortality in urban districts is high when compared with rural districts, especially for urban areas of 10,000 inhabitants and upwards, where the aggregate rate is 96 per 1,000 births. This high rate is due to the mortality in the county boroughs and in Kilkenny, for of the towns composing these areas the remaining six show rates considerably below the aggregate figure: the individual rates for the 11 areas over 10,000 are as follows:—Limerick county borough (117), Waterford county borough (110), Kilkenny (106), Dublin Registration Area (99), Cork county borough (85), Drogheda (84), Dundalk (82), Galway (81), Sligo (69), Wexford (58), and Tralee (48). Deaths of infants in urban districts of less than 10,000 inhabitants were equivalent to a rate of 82 per 1,000 births.

The following statement gives the infant mortality for each sex for urban and rural areas:—

Statement showing the INFANT MORTALITY per 1,000 Births, by sexes, and at different periods of life in 1929, in relation to urban and rural areas.

This table shows, in addition to the record of higher mortality of males at the various ages in the four groups of the population into which it is divided, and the great disparity in the rates for urban and rural areas, the very large proportion of infants who die before reaching their first month of life. More than 33 per cent. of the infants who died in urban areas, and nearly 39 per cent. of those in rural districts, were under one month old. This age period is sub-divided in Table 13 and it will be seen from it that, of the total mortality rate for urban areas, 8.72, or 9.4 per cent., and for rural areas 6.26 or 10.8 per cent., were deaths of infants under one day old.

DEATHS OF ILLEGITIMATE INFANTS.

The number of deaths of illegitimate infants under one year of age registered during the year 1929, was 546, consisting of 293 deaths of males and 253 of females. Based on the number of illegitimate births registered, the resulting mortality rate is 295 per 1,000 births for both sexes, 309 per 1,000 for males and 280 per 1,000 births for females, as compared with 307, 326, and 286, respectively, in 1928. In other words, ten out of every 34 illegitimate infants born alive in 1929, died before the completion of their first year of life.

The illegitimate infant mortality, as derived from the records for 1929, is about 5 times the mortality among legitimate infants, which was 63 per 1,000 births for both sexes, 71 per 1,000 for males, and 55 per 1,000 births for females.

In Northern Ireland in 1929, the illegitimate infant death-rate was 169 per 1,000 births; and in England and Wales, the illegitimate infant death-rate was 126 per 1,000 births, or about one death to every 8 illegitimate infants born alive. This rate is about twice that for legitimate infants.

Table 14 shows the number of deaths by causes and at different periods of life under one year of age. On account of the smallness of the numbers it was not considered desirable to calculate rates for each cause by age-periods. Rates are, however, given for all deaths at each age period. It would appear from this table that at every period of life, the mortality among illegitimate infants is much in excess of that for all infants, as shown in Table 11.

It will be seen from Table 15 that 259, or 47 per cent. of the total number of deaths of the illegitimate infants occurred in Dublin county and city. Of the 72 deaths in the county, 58 took place in institutions, and of the 187 city deaths, the number in institutions was 167. Thus, 34 of the 259 deaths in Dublin county and city did not occur in institutions. Of the latter, 2 were described in the registers of death as "nurse children," both of these occurring in the city.

METEOROLOGY.

The following observations taken at 40 Fitzwilliam Square, Dublin, have been kindly furnished by Sir John W. Moore, M.A., M.D., D.P.H., Dublin; D.Sc., Oxon., F.R.C.P.I., F.R.Met.Soc.

"During 1929 the rainfall was $27 \cdot 265$ inches, or $0 \cdot 105$ inch under the average annual measurement of the thirty-five years 1881-1915, inclusive, viz., $27 \cdot 370$ inches. The most marked feature of the rainfall was its uneven seasonal distribution: $40 \cdot 2$ per cent. of the year's total fell during the last two months of the year, and the rainfall of the last three months was within $0 \cdot 607$ inch of that of the previous nine months. The quarterly distribution was as follows:— $3 \cdot 189$ inches in the first quarter, $4 \cdot 199$ in the second, $6 \cdot 548$ in the third, and $13 \cdot 329$ in the fourth.

"There were 193 'rain-days' in the year (i.e. days on which not less than $\cdot 005$ inch of rain fell). This was 5 days less than the average for 1881-1915. On no occasion in 1929 did more than an inch of rain fall on a given day in Dublin, but on August 3rd 0.966 inch was measured.

"January was one of the coldest winter months experienced in Europe for very many years, but in Ireland no persistent or extreme cold was felt, and at times relatively warm spells occurred owing to the northward movement of equatorial air along the western seaboard. A special feature of the month was its cloudiness, the percentage of cloud being estimated to reach the high figure of $80 \cdot 6$. February was a dull, cold and cheerless month: over the greater part of Ireland the rainfall was heavy, but this country to a great extent still escaped the severe cold which visited Great Britain and Continental Europe. March established a record for sunshine and drought, but the nights were frequently cold, damp and foggy. The contrast between day and night conditions reached an extreme on Easter Eve, the 30th, when an unclouded sun and south-west wind sent the thermometer from $39 \cdot 5^{\circ}$ to $69 \cdot 0^{\circ}$ within a few hours—a remarkable diurnal range of some 30° , which is very unusual in a seaside city.

"April was also cold and dry, with a continued prevalence of winds from Polar quarters and an absence of gales. Marked features were low night temperatures, a sudden incursion of a warm equatorial wind on the 16th, and a remarkable, rapid and extreme relapse of temperature on the 19th, the ensuing cold spell lasting to the end of the month. May, for the most part, proved a favourable spring month, though the first half was cool and unsettled, and in all parts of Ireland rain fell heavily. Anticyclonic conditions became established for a time on the 16th, and the latter half of the month was characterised by generally fine and much warmer weather. June, while cool, was in most respects favourable. Sunshine was above the average, and rainfall, if frequent in the first half of the month, was moderate in amount, and in the form of passing showers. Not one day—in Dublin at all events—could be described as a 'wet day.' Thunder and lightning visited the counties of Dublin and Wicklow on the 8th.

"Except in the south and west, where rain fell heavily, July may be described as a favourable month. On the first few days, however, the skies were clouded and temperature low, and a thunderstorm, followed by a cool spell, passed over Dublin on the 5th: but on the 10th a brisk and very warm S.W. wind ushered in a prolonged spell of really summer-like weather. The warm weather ended on the 21st when heavy rain fell, and a cool, dry spell followed, which, in turn, was succeeded by broken rainy weather. August, in the Dublin district, was an extremely showery month. Rain fell in measurable quantities on as many as twenty-three days to the large amount of 3·876 inches, but nearly two-thirds of that copious downpour was measured on three days, the 3rd, 5th and 6th, a thunderstorm passing over the city on the last date. September may be aptly described as favourable in regard to weather and pleasant in all respects. Only on the 28th and 29th did rain in substantial amount fall in Dublin, and the combined precipitation on those two days represented nearly 73 per cent. of the total rainfall for the month.

"The leading features of October were a cyclonic spell over the first eight days, culminating in a rainstorm on the 7th, an anticyclonic spell from the 9th to the 15th, during which summer-like conditions prevailed, and, lastly, a return to Atlantic weather and an advance towards winter temperatures. On the 26th the Dublin Mountains appeared with the first snow-covering of the season. November was one of the wettest Novembers on record in the southern half of the British Isles. At Valentia, 9·8 inches fell, at Dunmanway 12·25 inches, and at Dublin 4·867 inches. December proved a stormy, wet month. Only for a brief period, from the 15th to 18th, did anti-cyclonic conditions prevail, causing a respite from storm and rain. For the rest, there was an almost uninterrupted passage of generally deep and energetic depressions across the Atlantic in a north-easterly direction. There was little frost or snow during the month, which closed with a fine, quiet and sunny day. A noteworthy feature of the month was the low mean atmospheric pressure, only 29·498 inches: the range of pressure was also of unusual magnitude, namely 2·540 inches."

Particulars regarding meteorological observations taken at the Ordnance Survey Office, Phoenix Park, and at Roche's Point, Co. Cork, are published in the Quarterly Returns of Marriages, Births, and Deaths.

E. P. McCARRON,

Registrar-General.

Note.—The above populations, from 1801 to 1910, are derived from the estimated populations of Ireland, already published in previous Annual ports, by applying to those populations the proportion borne by the Saorstát Eireann area, as disclosed at each Census. The variations between proportions at each successive Census were distributed regularly over the intercensal periods.

The populations of Ireland were obtained as follows:

The populations of Ireland were obtained as follows:—
From 1801 to 1831 by adopting the rates of increase of the male and female population between 1821 and 1831, as shown by the Irish Census Reports of 1831—the first complete Census of Ireland having been taken in 1821.

1832—1841.—By adopting the rate of increase between the population of 1831 and 1841, according to the Irish Census Report of 1841.

1842—1846.—By taking the English average birth-rate of 1 in 31, and death-rate of 1 in 45, and deducting the annual emigration from Ireland according to the returns received from the Emigration Commissioners in England.

1847—1851.—The English birth-rate, as above, was used, deducting the number of deaths and the number of emigrants in each year, as given in the Irish Census Reports of 1851. An allowance, proportioned to the number of recorded deaths and the number of emigrants being made in each year for the excess of the number thus arrived at for 1851 over the actual population according to the Census of that year.

1852—1871.—The English birth and death rates, as above, were used, deducting the number of emigrants, according to the returns obtained by the Registrar-General for Ireland, and allowing for excess over Census numbers for 1861 and 1871, as explained for the last period.

1872—1910.—By adding the births registered in each year to the estimated population for the previous year, deducting the deaths and the number of emigrants, and adjusting the results for the years 1872-81, 1882-91, 1892-1901, and 1902-1911, to allow for the discrepancy between the number of this arrived at for 1881, 1891, 1901 and 1911, respectively, and the population as shown by the Census of these years.

From 1911 to date, the populations were estimated by adding the Births registered to the population of the area at the Census of 1911, and deducting the Deaths registered and the emigrants enumerated each year. (From 1922 the net number of Emigrants has been employed in the estimates, the number of Immigrants having become available through the Department of Industry and Commerce). Adjustments were made during 1915-1921 to cover the movements of British Military; and at the Census of 1926, the estimates were revised according to the difference disclosed between the estimate for that year (calculated to the Census date) and the population at the Census, by a distribution of the difference in arithmetical progression over the preceding fifteen years.

*At the Census of 1851, the ages of 2,646 persons (1,499 males and 1,147 females) were unspecified. In 1861 the numbers unspecified were 3,138 (2,029 males and 1,109 females); in 1871, 3,128 (1,872 males and 1,256 females); in 1881, 1,909 (1,093 males and 816 females); in 1891, 1,460 (696 males and 764 females).

PROVINCE OF LEINSTER.—MARRIAGES, BIRTHS AND DEATHS, 1929.

SUPERINTENDENT REGISTRARS' DISTRICTS, BY COUNTIES.

iWherever the minus sign(—) is prefixed to the numbers given in the column headed "Excess of Births over Deaths," it denotes that the births, instead of exceeding the deaths, were, in fact, less than the deaths to the extent stated.}
